-!- FUNCTION: THIS PROTEIN IS PROBABLY A COMPONENT OF THE ACTIVE POLYMERASE. IT MAY FUNCTION IN RNA SYNTHESIS, CAPPING, AS WELL AS METHYLATION OF CAPS, AND POLY(A) SYNTHESIS.

-!- SUBUNIT: THOUGHT TO FORM A TRANSCRIPTION COMPLEX WITH THE NUCLEOCAPSID (N) PROTEIN.

-!- SIMILARITY: WITH THE L PROTEIN.

"Alpha-conotoxin AulB selectively blocks alpha3 beta4 nicotinic acetylcholine receptors and nicotine-evoked norepinephrine release.";
J. Neurosci. 18:8571-8579 (1998).
-I- FUNCTION: ALPHA-CONOTOXINS ACT ON POSTSYNAPTIC MEMBRANES, THEY BIND TO THE NICOTINIC ACETYLCHOLINE RECEPTORS (NACHR) AND THUS INHIBIT THEM. THIS PEPTIDE BLOCKS MAMMALIAN NICOTINIC ACETYLCHOLINE RECEPTORS COMPOSED OF ALPHA-3/BETA-4 SUBUNITS.
-I- MASS SPECTROMETRY: WM=1725.6; METHOD=ELECTROSPRAY.

-I- FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY

CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBUNITS 1-

3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. COI IS THE

CATALYTIC SUBUNIT OF THE ENZYME COMPLEX. COI IS THE

CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER FORMED BY HEME A3

AND COPPER B (BY SIMILARITY).

-I- CATALYTIC ACTIVITY: 4 FERROCYTOCHROME C + O(2) = 2 H(2)O + 4

FERRICYTOCHROME C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -:- COPACTOR: TWO HEME (A AND A3) GROUPS AND COPPER B (BY SIMILARITY).
-:- PATHWAY: TERMINAL STEP IN THE RESPIRATORY CHAIN.
-:- SUBCELLOIAR LOCATION: INTEGRAL MEMBRANE PROTEIN (BY SIMILARITY).
-:- SIMILARITY: BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BS106 is a breast tissue gene with which breast cancer and related diseases are associated. The BS106 polypeptides AAW42089-W42092 can be utilized in a variety of of assays for the detection of antibodies to breast tissue. They can also be used as immunogens for the detection of antibodies to breast tissue. The products and methods discussed in this invention can be used for detecting, diagnosing, stading, preventing or treating, or detecting predisposition to diseases or conditions of the breast such as breast cancer.
                                                                                                                                                              Gaps
                                 mediated tissue damage such as occurs in the course of autoimmune diseases. e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or treat or prevent tumor cell metastasis. This peptide corresponds to AA 161-180 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting BS106 gene products - useful for developing products for detecting, staging, preventing, treating or determining predisposition to e.g. breast cancer
                                                                                                                                                                                                                                                                                                                                                           Human; BS106; breast tissue gene; breast cancer; detection marker.

The invention provides BS106 polynucleotides (AAX55578-82) and polypeptides (AAX13466-470). The BS106 nucleic acids correspond to a breast tissue gene and can be used as markers for breast tissue disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining diseases or conditions associated with BS106, especially breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ij

This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (in)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A), and related compositions, are used to induce an antibody response to cariogenic acceptation compositions, are used to induce an antibody response to cariogenic streptococcus mutans, S. rattus, S. cricetus or S. sobrinus), especially to prevent colonisation, to reduce numbers of bacteria or to reduce incidence of caries, in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of theth. The produces a conjugate which induces significant immunity to both components, resulting in immunological memory and children.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Angiostatin; plasminogen; human; thiol donor; activator; tumour; angiogenic disease; rheumatoid arthritis; atherosclerosis; eye disorder; cardiovascular; cerebral vascular; diabetes; immune disease; plasmin; chronic inflammation.

used to for the treatment of anglogenic disease. The generated anglostatin is a protein that is a fragment of plasminogen having the same N-terminal amino acid sequence as plasmin and a C-terminus in damino acid sequence as plasmin and a C-terminus in thingle 5. The generated anglostatins are used to treat anglogenic disease, e.g. tumours and their metastases, rheumatoid arthritis, atherosclerosis, eye, cardiovascular, cerebral vascular or diabetes associated disorders, or immune diseases such as chronic inflammation. A DNA that encodes the protein optionally linked to expression control elements can be used in gene therapy to treat the same diseases. Antibodies that bind selectively to the native anglostatin are used in standard immunoassays for detection or determination of anglostatin for diagnosis or monitoring of anglogenesis, and affinity purification. These methods allow anglostatin to be produced on a large scale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Angiostatin; plasminogen; human; thiol donor; activator; tumour; anglogenic disease; rheumatoid arthritis; atherosclerosis; eye disorder; cardiovascular; cerebral vascular; diabetes; immune disease; plasmin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This represents the human native angiostatin C-terminal sequence. This was deduced to be a plasminogen fragment. The invention provides a method for in vitro generation of angiostatin which comprises treating plasminogen with a plasminogen activator and a sulphydryl (thiol) donor. The thiol donor converts the plasmin to angiostatin which can be

                                                                                                                                    elements can be used in gene therapy to treat the same diseases. Antibodies that bind selectively to the native angiostatin are used in standard immunoassays for detection or determination of angiostatin for diagnosis or monitoring of angiogenesis, and affinity purification. These methods allow angiostatin to be produced on a large scale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a possible cleavage site in proSKI-1 which may be targeted by a zymogen to form mature subtilisin-kexin isoenzyme 1 (SKI-1). The conserved site was identified by alignment of SKI-1 with other subtilases. SKI-1 is a type-1 membrane-bound proteinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel soluble proteic fragment of subtilisin-kexin isoenzyme for producing a polypeptide useful for treating hypercholesterolemia, liver steatosis and amyloidosis, comprises a specific amino acid sequence -
                                                               disease, e.g. tumours and their metastases, rheumatoid arthritis, atherosclerosis, eye, cardiovascular, cerebral vascular or diabetes associated disorders, or immune diseases such as chronic inflammation. A DNA that encodes the protein optionally linked to expression control
used to for the treatment of angiogenic disease. The generated angiostatin is a protein that is a fragment of plasminogen having the same N-terminal amino acid sequence as plasmin and a C-terminus in

0
which cleaves pro-brain-derived neurotrophic factor. Peptides which bind to and are cleaved by SKI-1 may be used for monitoring SKI-1 activity, for screening enhancers of SKI-1 activity, or for screening enhancers of SKI-1 activity. Proteic fragments of SKI-1 which bind to the SKI-1 catalytic site may be used as inhibitors of SKI-1 activity. They may be used to treat diseases involving overexpression of SKI-1 or SKI-1 substrate. Such diseases include hypercholesterolaemia, high levels of fatty acids, lipids or farnesyl pyrophosphate, liver steatosis, Ras-dependent cancer, restenosis and amyloid protein formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method for determining the conformational state of a protein. The method uses at least one labelled binding partner capable of binding to the protein in a manner dependent on the conformational state of the protein. The method is for detecting the conformational state of a protein, for detecting post-translational modifications of proteins, and for determining the activity of an enzyme. The present sequence represents a binding partner of human p47-phox. p47-phox is a substrate of protein kinase C Detection of the conformational changes in p47-phox is used to measure protein kinase C activity, using the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                 Conformational state; post-translational modification; enzyme activity;

times sequence is an antigenic Iraqment of an isologim, of the human Stat6 (signal transducers and activators of transcription), of the invention. The detection and/or quantitation of DNA or anticons of Stat6 and/or Stat6 and/or Stat6 can be used to detect differential expression of Stat6 isoforms in numerous diseases, including myeloid cancer, asthma, sarcoma, scleroderma, bone marrow fibrosis, fibrotic diseases and AIDS: The nucleic acids can be used to screen genomic or CDNA libraries or to identify complementary sequences. The identification of the genetic locus of the Stat6 gene can be used to screen detection of chromosomal aberrations of the Stat6 gene can be used for detection of chromosomal aberrations and translocations involving the Stat6 gene. Antibodies against the isoforms can be used to detect the statescription the isolated and/or Stat6c in a sample. Because of the transcription the isolated and purified forms can be used to study gene transcription the isolated and purified forms can be used to study gene can be used as agonists or antagonists. The two polypeptides may also be used in gene therapy protocols. In particular, stat6b and/or Stat6c can therapeutically modulate the development and differentiation of B and CT cells and can enhance IL-4 immunological function in immunocompromised individuals, Stat6 activation correlates with function of gene correlated regulator of gene correlated regulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stat6; Stat6b; human; signal transducers and activators of transcription; isoform; myeloid cancer; asthma; sarcoma; scleroderma; fibrotic disease; bone marrow fibrosis; AIDS; Stat6c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isoforms of Stat6 - having differential effects on the modulation of Stat6 activity in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is an antigenic fragment of an isoform of

The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes e.g. from Arabidopsis thaliana (see AAG83361-AAG84504). The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and development. The present peptide was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Plasminogen; human; Kringle 5 peptide; anti-angiogenesis agent; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      metastatic solid tumour; carcinoma; sarcoma; lymphoma; haemangioma; psoriasis; arthritis; macular degeneration; diabetic retinopathy; autoimmune disease; ocular disease; capillary proliferation; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a set of complementary peptide ligands
generated from Mycoplasma genitalium genome sequences. These
specific complementary peptides interact with their relevant target
proteins encoded by the microbial genome. They are capable of
another protein or receptor and are thus useful as reagents and drugs,
another protein or receptor and are thus useful as reagents and drugs,
and as lead ligands to facilitate drug design and development. They
are useful as tools for functional genomic studies, reagents for the
configuration of high-throughput screens, as a starting point for
therapeutic agents. The analysis and acquisition of peptide sequences
facilitates understanding of protein-protein interactions. The method
allows for analysis of an entire database at a time, thus overcoming
sampling problems. The present sequence is provided as an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is synthetic a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence, are anti-analyogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemanglomas. They can also be used for treating or preventing comparists, arthritis, macular degeneration and diabetic retinopathy. The fragments can also be used to treat autoimmune or coular diseases, capillary proliferation within atherosclerotic plaque, haemophiliac conjubit ovulation and establishment of the placenta. K5 antiscra or inhibit ovulation and establishment of the placenta. K5 antiscra or can any be used to induce angiogenesis, e.g. for wound challing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis. The Ab are used to indentification of smaller cresponse to the peptides or used for detect/quantify the peptides in antibodies and confidential capillation of smaller confidential capillation of endothelial cells with low toxicity against inhibit proliferation of endothelial cells with low toxicity against commal cells. Typically they have 800-times greater inhibitory activity commal cells. Typically they have 800-times greater inhibitory activity commal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

The invention relates to a method of preparing plasminogen kringle 5
c peptide fragments. The method comprises mixing mammalian plasminogen and
c elastase in the ratio 1:100-1:300, followed by incubating and isolating
the fragment. The kringle 5 peptides are inhibitors of anglogenesis and
cendothelial cell proliferation and migration. The peptides are useful
c endothelial cell proliferation and migration. The peptides are useful
c for treating anglogenic diseases, primary and metastatic solid tumours
c and carcinomas of various organs such as breast, genital tract,
cendocrine glands, skin, tumours of the brain and eyes and solid tumours
arising from haematopoietic malignancies such as leukaemias and
cliseases (e.g., rheumatold arthritis), ocular diseases, skin diseases
(e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber
CS yndrome), diseases caused by excessive or abnormal stimulation of
condothelial cells (e.g., crohn's disease, atherosclerosis), diseases
which have anglogenesis as a pathologic consequence (e.g., cat scratch
disease and ulcers). The peptides are also useful as a birth control
agent which inhibits ovulation and establishment of the placenta.
Sequences Aab01888, AAB01889 and AAB01895-B01905 represent human
c plasminogen kringle 5-derived peptides synthesised and used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preparation of Kringle five peptide fragment for treating various slackers such as anglogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -

The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a
reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
a less therapeutically active amino acid region (IV), which covalently
bonds with amino/Mydroxyl/thiol groups on blood components to form a
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity
in vivo for the treatment of various disorders. Endogenous therapeutic
peptides are not suitable as drug candidates as they require frequent
administration due to rapid degradation by peptidases in the body.
Modifying and attaching therapeutic peptides to albumin prevents or
reduces the action of peptidases to increase length of activity (half
ilfe) and specificity as bonding to large molecules decreases
intracellular uptake and interference with physiological processes.

AAB90829 to AAB92441 represent peptides which can be used in the
exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6211427
GENERAL INFORMATION:
APPLICANT: Cottingham, Ian R.
APPLICANT: Garner, Ian
TITLE OF INVENTION: Peptide Production as Fusion Protein in
TITLE OF INVENTION: Transgenic Mammal Milk
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 8;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADDRESSEE: STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C. Hollman G.M., Cook B.J., Nachman R.J.;
Primary structure and synthesis of a blocked myotropic
neuropeptide isolated from the cockroach, Leucophaea maderae.";
Comp. Blochem. Physiol. 85c:219-224(1986).
-!- FUNCTION: MEDIATES VISCERAL MUSCLE CONTRACTILE ACTIVITY
(MYOTROPIC ACTIVITY).
-!- MISCELLANBOUS: AN ANALOG WITHOUT THE N-TERMINAL PCA RESIDUE WAS
SYNTHESIZED AND FOUND TO EXHIBIT GREATER ACTIVITY (144%) THAN THE
PARENT NEUROPEPTIDE. THE PORTION OF THE SEQUENCE OF LPK MOST
CRITICAL FOR THE MYOTROPIC PROPERTIES IS LIMITED TO THE
PENTAPEPTIDE FRAGMENT FTPRL.
                                                                                                       01-13AN-1990 (Rel. 13, Created)
